Section 1

Section 2

IAM posture refreshes periodically (6 hours) to balance visibility with API and performance costs.

Multi-cloud filters centralize IAM visibility across environments.

Card 1	Card 2	Card 3	Card 4
245	32	87	14
Total Identities	High Risk	Unused Permissions	Admin Access

High | Medium | Low

(●) Risky Only ( ) All

Sort by: Risk Score ▼

Identity	Type	Risk Score 0-100	Unused	Last Active	View
prod-admin-role	Role	92	14	2 days ago	Link
svc-billing-export	Service Account	81	9	7 days ago	Link
legacy-data-migration-role	Role	68	18	120 days ago	→

"Risky Only" view reduces noise by filtering low-risk identities during focused security reviews

Identities are sorted by risk score (highest first) to prioritize investigation and reduce review time.

Identity inactive for 120+ days with high unused permissions indicates potential privilege creep.

← Back to Dashboard

Identity: prod-admin-role
Type: Role
Account: AWS-Production
Last Activity: 2 days ago

Identity metadata provides investigation context before remediation.

Risk Score: 92 / 100 (High)
High risk due to admin-level privileges and unused wildcard access.
Admin Policy Attached +30
Wildcard Permissions (s3:*) +20
Unused Permissions (90+ days) +15
Privilege Escalation (iam:PassRole) +15
Sensitive Service Access (KMS/IAM) +12

Risk score uses transparent weighted factors to avoid black-box decision making.

(●) Risky Only ( ) All Permissions

Permission	Resource	Last Used	Risk Category	Recommended Action
s3:*	*	120 days	Wildcard	Remove (Unused 120d)
iam:PassRole	*	60 days	Priv Escalation	Review Escalation Risk
ec2:FullAccess	*	90 days	Admin	Reduce to Specific Resources

Collapsible sections preserve investigative depth without overwhelming the interface.

Projected Risk: 92 → 54

System previews risk reduction impact before applying changes.

[Simulate Removal]
[Mark for Review]

Last-used metadata helps identify unused or stale access.

Permissions are categorized to clarify why they contribute to overall risk.

Simulation enables safe access reduction before applying changes.

Simulate Permission Changes

Simulation Results

Current Risk Score: 92
Projected Risk Score: 54
Risk Reduction: -38
Removing unused wildcard (s3:*) and reducing admin scope significantly lowers exposure.

Simulation gives measurable confidence before applying changes.

Impact Analysis

Permission	Current Access	After Change	Impact
s3:*	Full Access	Removed	No usage in 120 days
iam:PassRole	Broad	Restricted	Review required
ec2:FullAccess	Full	Scoped to specific resources	Low disruption risk

Workload Impact Assessment:
No active API calls detected in last 90 days.
No production service dependency found.

System validates usage data to prevent breaking workloads.

Change Type: High-Risk IAM Modification
Approval Required: Yes
Approver: Security Admin

Built-in approval workflow supports enterprise governance.
